MOM Summary 22.01

The problem

- The mental health issue (3 in 5 people have) : clinical depression, anxiety, stress, etc.
- Physciatrist vs therapist : majority is therapy, no-medicine-administered treatment
- Empathetic AI: no diagnosis, but voice sentiment analysis:
  `Your voice seems down today, how was your day?`
- Therapy is expensive

Tasks (week 1)

- Standalone application : website
- Think of a name
- Do a bit of learning in the area, and get a first draft of requirements
- Think of an architecture/tech stack : can use smallest.ai api
- Think of a target audience
- Reading materials by Founder (to be given): blogs, market analysis that the startup did
- An updated requirements to be done

Possible issues to be addressed

- Sensitive, very low error chance : liability
- Private data : no therapist wants to (or can share due to privacy laws)
- Performance (the responses)
- RAG: should not ask who I am, what my age is, when my wife's birthday is, etc every time I talk to it. Should remember some details.
